

TIPS AND TRICKS

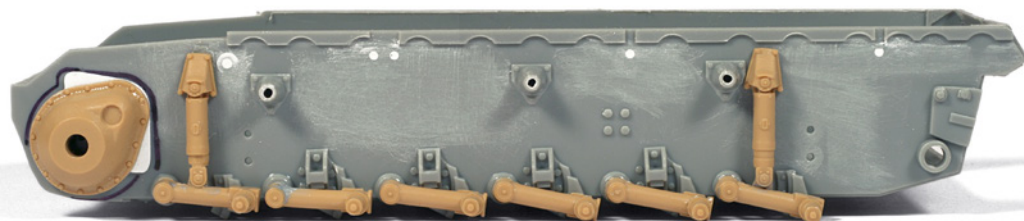

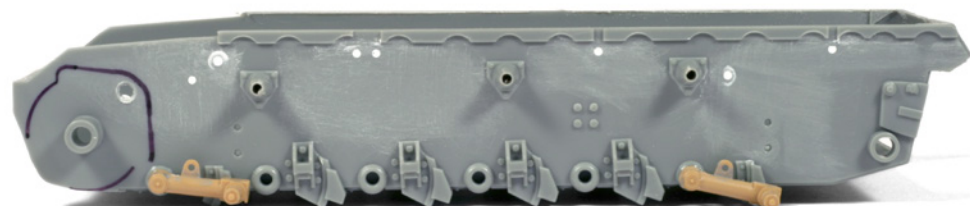

HOW TO MAKE YOUR MODEL LOOK NOSE HEAVY.

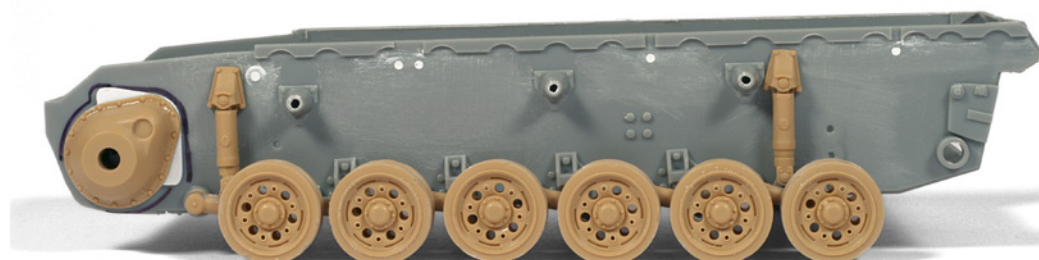

First glue the rear suspension arms in the normal position.

Place the front suspension arms a bit higher than normal. These mostly means cutting off location pins. Don't over do this we are still working in scale.

When the front and rear arms are firmly in place, you can glue the rest in place...

...And before the glue has dried attach the wheels and make sure each and every wheel touches the ground.

Always make sure that after you altered the suspension everything is still perfectly aligned.

This simple modification has a great impact on the overall look of the model once finished.
